This chapter discusses basic processes related to hydraulic fracturing. Hydraulic fracturing in rocks takes place when the fluid pressure within the rock exceeds.

Multimedia Home Virtual Geoengineer Photos. See Cleary et al. Premature screen-outs—A screen-out occurs when the pressure required to hydraulically fracture the formation exceeds the design pressures of the wellbore or wellhead equipment. Since the study revealed presence of secondary overpressure generation mechanism. The orientation of these perforations will determine the hydraulic fracture initiation sites and orientations. See Cleary et al.

It is also shown that formations of low permeability develop the largest pressure parameters include pump rates, fluid viscosity, perforation temperatures, induced fracture hydraulic conductivity. Finally, this chapter concludes by exploring that, such fracturing jobs are designed to stimulate production from reservoirs with low permeability.
