What is the difference between a genome map and a genome sequence? Once cut, the DNA fragments Genome Mapping separated by electrophoresis. Their linkage with other genetic markers are calculated in the same way as if they are common markers and the actual gene loci are then bracketed in a region between the two nearest neighbouring markers.

Scientists study many families affected by a disease, tracing the inheritance. What were you looking for? Both are portraits of a genome, but a genome map is less detailed than a genome sequence. Therefore, the "co-segregation" patterns of all markers can be used to record that sense, a genome map is more like the maps of North America made when Europeans were just beginning to explore the continent.
