Similarly in vitro models of treatment appear to correlate reduction in fungal load with galactomannan []. There is substantial interest in pairing cell wall-active echinocandins with either amphotericin B formulations or mould-active azoles as therapy for invasive aspergillosis. Summary We have gained substantial knowledge regarding how the immune system recognizes inhaled fungi and calibrates the inflammatory response.

Therefore, our immune system requires the ability to recognize inhaled mould. From Diagnosis To Prevention. We are also learning more about the biology of Aspergillus species that might be exploited therapeutically. Important advances have been made in diagnosis of invasive aspergillosis and in antifungal agents. Therapeutic drug monitoring for voriconazole should be considered, particularly because of considerable inter-individual variability and intra-individual variability over time in voriconazole exposure [7677].
